Meanwhile, the CQC method combines responses based on the use of cross-modal coefficients, which reflect the duration and frequency content of the seismic events as well as the modal frequencies and damping ratio of the equipment. In this study, numerical analyses using a finite element method, that is, static and dynamic analyses according to the rigid or flexible characteristics of the dynamic properties of a butterfly valve, were performed according to the KEPIC MFA. The recommendation is from long ago and is based on the fact that the predominant frequencies in these applications, you can buy globe valves that are suitable. Stem seals are accomplished either with packing in a conventional stuffing box or by means of O-ring seals.
